

E.A.6.8 (Graph Colouring with Red Self-Loops)

1.1 Modellazione

Dati i parametri $G = (V, E)$ siano

- $\mathcal{C} = \{R, B, C\}$
- $X = \{X_v^c \mid v \in V \wedge c \in \mathcal{C}\}$ l'insieme di variabili dove
 - X_v^c è vera se il nodo v ha colore c

Il problema presenta 4 vincoli

$$\phi = \phi_1 \wedge \phi_2 \wedge \phi_3 \wedge \phi_4$$

(ALO) Ogni nodo ha almeno un colore.

$$\phi_1 = \bigwedge_{v \in V} \bigvee_{c \in \mathcal{C}} x_v^c \quad (1)$$

(AMO) Ogni nodo ha al più un colore.

$$\phi_2 = \bigwedge_{\substack{v \in V \\ c_1, c_2 \in \mathcal{C} \\ c_1 < c_2}} X_v^{c_1} \rightarrow \neg X_v^{c_2} \quad (2)$$

1. Non esistono nodi collegati da un arco colorati con lo stesso colore.

$$\phi_3 = \bigwedge_{\substack{(u,v) \in E \\ c \in \mathcal{C} \\ u < v}} X_u^c \rightarrow \neg X_v^c \quad (3)$$

2. Ogni nodo $v \in V$ che ha un cappio (un arco da v a v) è colorato con il colore R .

$$\phi_4 = \bigwedge_{(v,v) \in E} X_v^R \quad (4)$$

1.2 Istanziamento

1.2.1 Parametri e variabili
